20. ABSTRACT (Continue on reverse side if necessary and identify by block number)  This report documents the results of the first phase of a two-phase program aimed at developing for the U. S. Air Force experimentally tested computer models to predict worst-case potentials for air quality degradation resulting from use of current and potential future turbine engine (jet) fuels. The development and testing of such models requires an adequate data base derived from appropriate environmental chamber experiments and laboratory studies. In Phase I of this two-phase program, a total of 131 environmental		

20. CONCLUDED

chamber experiments were carried out in a ~6400-liter, all Teflon<sup>®</sup> indoor environmental chamber and several kinetic measurements were made in order to obtain data required for model development. The chamber experiments included 47 single component-NO<sub>x</sub>-air irradiations of various representative fuel constituents and potential future fuel impurities, 15 fuel-NO<sub>x</sub>-air irradiations employing one whole and six synthetic surrogate fuels, and 69 control or characterization runs.

The compounds studied in the single component-NO<sub>x</sub>-air irradiations included the representative fuel constituents n-butane, n-octane, and methylcyclohexane; the representative aromatics benzene, toluene, n-xylene, m-xylene (1,3,5-trimethylbenzene), tetralin (1,2,3,4-tetrahydronaphthalene), naphthalene, and 2,3-dimethylnaphthalene; and the potential future impurities furan, thiophene, and pyrrole. Pyrrole, furan, and the methylbenzenes were found to be the most reactive in terms of rates of O<sub>3</sub> formation, with benzene, tetralin, the naphthalenes, and thiophene having intermediate reactivity, and the alkanes being, by far, the least reactive. The large differences in reactivity observed between these classes of compounds is primarily due to the differing effects their photooxidations have on radical levels in NO<sub>x</sub>-air irradiations, with the OH radical rate constant determining relative reactivities within a given class of compounds.

The fuel-NO<sub>x</sub>-air runs showed that changes in the composition of these fuels can significantly affect their atmospheric reactivity. Increasing the total level of aromatics in the 15-component synthetic fuel resulted in increased rates of O<sub>3</sub> production, but also resulted in lower maximum O<sub>3</sub> yields. In contrast, increasing the ratio of alkylbenzenes to bicyclic aromatics (with the total aromatic concentrations unchanged) increased both the O<sub>3</sub> formation rates and the maximum O<sub>3</sub> yields. The addition of small amounts (1-2% on a mole carbon basis) of furan or pyrrole to the fuel resulted in dramatic increases in O<sub>3</sub> production rates and also suppressed O<sub>3</sub> yields, but the addition of comparable amounts of thiophene to the fuel had a relatively minor effect. The implications of these results for the photooxidation mechanisms of these compounds are discussed.

In associated kinetic studies, OH radical rate constants were obtained for pyrrole, tetralin, 2-methylnaphthalene, 2,3-dimethylnaphthalene, an O<sub>3</sub> reaction rate constant was determined for pyrrole, and NO<sub>3</sub> radical rate constants were determined for furan, thiophene, and pyrrole for the first time.

The results of this program provide an important and necessary data base required for the development of models for the atmospheric reactions of current and future turbine engine fuels. The development and testing of such models will be carried out in the second phase of this two-part program.

This technical report is divided into two volumes. Volume I contains a detailed summary of the experimental results and a discussion of their significance. Volume II contains a tabulation of the environmental chamber data gathered during the course of the experimental phase of this program. Volume II will only be available from Defense Technical Information Center or National Technical Information Services.

PREFACE

This report was prepared by the Statewide Air Pollution Research Center (SAPRC) of the University of California, Riverside, California 92521, under Contract No. F08635-80-C-0359, with the Air Force Engineering and Services Center, Air Force Engineering and Services Laboratory (AFESL/RDS), Tyndall Air Force Base, Florida 32403.

This report describes the first phase of a two-phase program aimed at developing experimentally tested models for the atmospheric reactions of turbine engine fuels. This phase consists of the experimental studies necessary for model development and testing. The second phase will consist of the necessary model and software development.

This technical report is divided into two volumes. Volume I describes the experimental results and discusses their significance. Volume II tabulates environmental chamber data gathered during the experimental studies phase of this program. For most purposes, Volume I is complete in itself but a few people may find it necessary to use Volume II in conjunction with Volume I. Initial distribution of Volume II was not made, but a copy was submitted to the Defense Technical Information Center. Those who need to use Volume II may obtain copies from the Defense Technical Information Center or from the National Technical Information Service (addressees are listed on inside of front cover).

This work was carried out between June 1983 and June 1984 under the direction of Dr. William P. L. Carter and Dr. Arthur M. Winer, Co-Principal Investigators, and Dr. Roger Atkinson, Program Manager. The principal research staff on this program were Ms. Margaret C. Dodd, Mr. William D. Long, and Ms. Sara M. Aschmann. Assistance in processing the data was provided by Ms. Lori A. Luisi and Ms. Mina P. Poe, and assistance in preparation of this report was provided by Ms. I. M. Minaich and Ms. Christy J. LaClaire.

Dr. Daniel A. Stone, AFESL/RDVS, was Project Officer for this contract.

This report has been reviewed by the Public Affairs Office (PA) and is releasable to the National Technical Information Service (NTIS). At NTIS it will be available to the general public, including foreign nationals.

This technical report has been reviewed and is approved for publication.

## SECTION I

### INTRODUCTION

To obtain an experimental data base required for the development and testing of computer models for the atmospheric reactions of present and future turbine engine fuels, a series of environmental chamber experiments was carried out using an ~6000-l all Teflon<sup>®</sup> chamber with a blacklight light source. The experiments can be categorized as follows:

- 47 single-component- $\text{NO}_x$ -air irradiations employing the representative fuel constituents benzene, toluene, m-xylene, mesitylene (1,3,5-trimethylbenzene), tetralin (1,2,3,4-tetrahydronaphthalene), naphthalene, 2,3-dimethylnaphthalene, n-butane, n-octane, and methylecyclohexane, and the potential future fuel impurities furan, thiophene, and pyrrole.
- 15 fuel- $\text{NO}_x$ -air irradiations employing a preliminary batch of shale-derived JP-4 and employing three formulations of a 15-component synthetic fuel, including one experiment each with furan, thiophene, or pyrrole added to one of the synthetic fuels as a model "impurity."
- 69 control or characterization runs, including 31  $\text{NO}_x$ -air irradiations to measure the chamber radical source and contamination by reactive organics,  $\text{NO}_2$  actinometry runs to monitor the light intensity, propane- $\text{NO}_x$ -air irradiations for control purposes, ozone dark decay determinations, and an acetaldehyde-air irradiation to measure  $\text{NO}_x$  off-gassing rates.

Detailed tabulations of the data from all these runs, other than the  $\text{NO}_2$  actinometry experiments, are given in Section II of this report. These tabulations are arranged in the order the runs were carried out. A concise chronological summary of the runs in this program, indicating the run number, type, and initial concentrations are given in Table I. This table also gives the results of the  $\text{NO}_2$  actinometry measurements (i.e.,

<sup>a</sup>NO<sub>2</sub> photolysis rate measured in NO<sub>2</sub> actinometry runs.

<sup>b</sup>No data tabulation for this run.

<sup>c</sup>The organic was added after a ~2 hour NO<sub>x</sub>-air irradiation. "Initial" organic listed is the amount added.

<sup>d</sup>Two pyrrole injections of ~0.1 ppm made.

k<sub>1</sub>, the NO<sub>2</sub> photolysis rate), since those data are not included in Section II. Gaps in the sequence of run numbers in Table 1 indicate runs carried out for other programs, whose results are not included in this report. A more detailed chronological summary, and other summaries of results of the various types of runs, are given in Volume I, and are thus not reproduced here.

The data tabulations given in Section II include the following information (where applicable):

- The indoor Teflon<sup>4</sup> chamber (ITC) run number.
- A brief run description.
- The date the run was carried out (given below the run description).
- The date the tabulation was printed (given in right hand corner on each page).
- Comments for the run, including experimental operations and operator's comments taken from the log book, problems encountered (if any), etc.
- The ITC bag number. Three reaction bags were used, numbered 101 through 103.
- The NO<sub>2</sub> photolysis rate ( $k_1$ ) assigned for this run (see Volume I).
- The initial concentrations of injected reactants which were monitored.
- The average temperature, its the (1 $\sigma$ ) standard deviation.
- Lists of all instruments used in these runs. For each instrument, this list indicates the ID number (used internally at SAPRC), the label identifying the instrument on the data tabulation, and a brief description giving information identifying the instrument and/or technique.
- The data tabulations. The tabulations indicate the compound or parameter measured, the units in which the measurements are reported, and the instrument. Because of space and format limitations, the compound names frequently had to be abbreviated on the tabulations. The meanings of representative abbreviations which may not be obvious are listed in Table 2. For each data point, the clock time and the elapsed time (in minutes) since the irradiation began (or since the first measurement for dark runs) are indicated.

TABLE 2. REPRESENTATIVE ABBREVIATIONS USED IN THE DATA TABULATIONS.

Abbreviation	Meaning
NO <sub>2</sub> -UNC	NO <sub>2</sub> readings, uncorrected for interferences by organic nitrates and HNO <sub>3</sub>
N-C8	n-Octane
I-C4	Isobutane
CYC-C6	Cyclohexane
MECYC-C6	Methylcyclohexane
ETCYC-C6	Ethylcyclohexane
I-C4=	Isobutene
T2-C4=	<u>trans</u> -2-Butene
M-XYL	m-Xylene
1,35-TMB	Mesitylene (1,3,5-trimethylbenzene)
I-C3-BENZ	Cumene (isopropylbenzene)
2-MENAPH	2-Methylnaphthalene
2,3-DMN	2,3-Dimethylnaphthalene
MEX	Methyl ethyl ketone <sup>a</sup>
PROX	Propene oxide <sup>a</sup>
BUTYRAL	Butyraldehyde <sup>a</sup>
LN C4/C3=	$\ln([n\text{-butane}]/[\text{propene}])$ , whose rate of change is used to derive OH radical concentrations <sup>b</sup>
RT-11.78	An unidentified compound which has a retention time of 11.78 minutes on the GC system employed
UNKN #1	An unidentified fuel constituent

<sup>a</sup>Or some other computer with the same retention time on the C-600 GC.<sup>b</sup>Concentration units are arbitrary; only the slope of the log is of interest.

- If any of the data are flagged (indicated by an "A", or "B", etc., immediately to the right of the value), footnotes giving the reason it is flagged appear at the end of the tabulation for the run.

The data tabulated in Section II are also available in computer readable format. Interested persons should contact Dr. W. P. L. Carter at SAPRC for more information.

NOTES

- R DB-5C-1 CANNOT RELIABLY MONITOR COMPOUNDS HEAVIER THAN N-C13,  
SO THE N-C14 DATA ARE PROBABLY NOT MEANINGFUL. N-C14 DATA  
FROM THIS INSTRUMENT ARE NOT REPORTED IN SUBSEQUENT RUNS.
- A AFTER ADDITION OF BENZENE, TOLUENE, P-XYLENE, AND MESITYLENE.  
B AFTER ADDITION OF 30 MICROLITERS PENTANE FLUSHED INTO ITC WITH NITROGEN.  
C 11.78 IS THE CALIBRATED RETENTION TIME.

ITC-788  
SYNTHETIC FUEL #1 + THIOPHENE + NOX  
1984 APR 13

NOTES

- A FLAME EXTINGUISHED AT FIRST PART OF CHROMATOGRAM AND RELIT.
- B STOPPED CHROMATOGRAM TOO SOON.
- C ROOM TEMP. INCREASED TO 29 C DURING THIS RUN--CHANGED R.T.'S ON ECD-1.
- D SAMPLE DILUTED 50% WITH NITROGEN.

ITC-796  
SYNTHETIC FUEL #2 - NOX  
1984 APRIL 24

NOTES

- A FLAME EXTINGUISHED AND RELIT IN EARLY PORTION OF CHROMATOGRAM.
- B COLUMN TEMPERATURE NOT COOLED TO 80 C (STILL AT 140 C) PRIOR TO FLUSHING. TENAX TUBE WITH N2 ONTO COLUMN.
- C COLUMN TEMPERATURE HAD NOT EQUILIBRATED TO 80 C (~85 C). R.T.'S ARE AFFECTED, PEAK WIDTHS ARE LARGER, BUT AREA SEEMS TO BE O.K.
- D PEAK OF 2-MENAPH NOT WELL ENOUGH RESOLVED FROM N-C14 TO OBTAIN A WIDTH AT HALF HEIGHT.

ITC-797  
NOX-AIR + N-OCTANE  
1984 APRIL 25

0645: START WET FLUSH.  
0820: STOP FLUSH. R.H. ~52% @ 80 F.

SYNTHETIC FUEL #3 - NOX  
1984 APRIL 27

NOTES

- A FLAME EXTINGUISHED AT EARLY PART OF CHROMATOGRAM AND RELIGHTED.
- B OFFSCALE ON X256, ATTENUATION CHANGE WHILE N-C14 WAS ELUTING. CANNOT GET WIDTH AT HALF HEIGHT.
- C 2-MENAPHTHALENE PEAK NOT WELL ENOUGH RESOLVED TO MEASURE WIDTH AT HALF HEIGHT. GAVE MU RESPONSE INSTEAD--NO FACTOR.
- D BUBBLERS A AND B HCHO CONDITIONED OVER WEEKEND.

SYNTHETIC FUEL #3 - NOX  
1984 MAY 1

NOTES

- A FLAME EXTINGUISHED AND RELIT DURING EARLY PORTION OF CHROMATOGRAM.
- B FLAME WAS OUT AT THIS POINT--MISSED PEAK.
- C TENAX TUBE BROKE WHEN HEAT DESORBER WAS PUT ON IT.
- D SAMPLE TAKEN AT THESE TIMES BUT THE PEAKS WERE UNUSUALLY BROAD AND POORLY RESOLVED--SUSPECT LEAK AREAS NOT CALCULATED BECAUSE THE PEAK SHAPES WERE SO DISTORTED. NEW TENAX TUBE USED.
- E NEW FERRULE BETWEEN G.C. COLUMN AND TENAX TUBE USED.
- F NEW TENAX TUBE USED.

ITC-802

SYNTHETIC FUEL #1 - NOX  
1984 MAY 4

NOTES

- A PEAKS UNUSUALLY BROAD. FOUND TENAX TUBE WAS PUSHED TOO CLOSE TO COLUMN DURING THE G.C. ANALYSES SO THE CONNECTION WAS NOT LEAK-PROOF.
- B PEAKS SLIGHTLY BROAD BUT ANALYSIS SEEMS O.K. OTHERWISE, I.E., AREAS LOOK REASONABLE COMPARED TO PRIOR PRE T=0 SAMPLE.
- C 2-METHYLNAPHTHALENE NOT WELL ENOUGH RESOLVED FROM N-C14 TO GET WIDTH AT HALF HEIGHT--HENCE NO AREA GIVEN FOR 2-MENAPH AT THIS SAMPLE TIME.
- D TEMPERATURE PROGRAMMER MALFUNCTIONED--REPLACED MISSED N-C6 AND CYC-C6.
- E FLAME EXTINGUISHED DURING EARLY PORTION OF CHROMATOGRAM AND RELIT.

ITC-806

NOTES

- A BETWEEN 1045 AND 1100 PDT, THE NO READINGS SUDDENLY SHIFTED BY 0.052 PPM AND THE NO<sub>2</sub> SHIFTED BY 0.012 PPM, AND THEN SHIFTED BACK EQUALLY SUDDENLY BETWEEN 1230 AND 1245. THE REASON FOR THIS IS UNKNOWN. THE TECO 14B-1 WAS SUBSEQUENTLY CHECKED AND FOUND TO BE OPERATING NORMALLY. THE INITIAL AND FINAL NO AND NO<sub>2</sub> DATA ARE ASSUMED TO BE CORRECT, AND THE NO, NO<sub>2</sub>, AND NOX DATA BETWEEN 1100 AND 1230 PDT ARE CORRECTED BY SUBTRACTING 0.052, 0.012, AND 0.064, RESPECTIVELY.
